

Per-tCO₂ sea-level response: model vs. historical-observation benchmark

Model: FaIR v2.2.4 + MimiBRICK v1.0.1. Calibration: FaIR-calibrate v1.4.5 (Smith et al. 2024) + post-PR#93 BRICK joint posterior (Wong, 2026). Emissions: Smith 2024 historical (1750–2020) spliced with 10,000 RFF-SP draws (Rennert et al. 2022) for 2021+; LHS-10k baseline + 0.01-GtCO₂ pulse at 2030. Hermans-TSLS expectation = TSLS $\times \int \Delta T_{\text{pulse}}(\tau) d\tau$, with TSLS from Hermans et al. 2021 (OS 17:181, historical-obs central value 0.40 ± 0.05 m/century/K) and ΔT_{pulse} from the v1.4.5 single-pulse FaIR driver.
