

A. NCPM benefit-cost decision logic

(per 150-m grid cell, decade-by-decade — Lorie 2020 §2.4.2)

1. If cell not at risk from 100-yr storm surge over next decade → no action.
2. Else: compare 30-yr discounted avoided damages (EAD reduction) vs. cost of adaptation. If $BCR \geq S$ → armor or elevate.
Tested at $S=1$ (optimal) and $S=4$ (sub-optimal).
3. Else: if 10-yr expected damages > property value → abandon.
Otherwise no adaptation.

B. Adaptation + residual storm-surge costs

C. Stylized illustration of FrEDI's 11-year rolling-average smoothing
