

Model vs. observations: temperature and sea level

Global mean surface temperature — model vs. observations

Global mean sea level — model vs. observations

Model: FaIR v2.2.4 + MimiBRICK v1.0.1. Calibration: FaIR-calibrate v1.4.5 (Smith et al. 2024) + post-PR#93 BRICK joint posterior (Wong, 2026). Emissions: Smith et al. 2024 historical (1750-2020) spliced with 10,000 RFF-SP draws (Rennert et al. 2022) for 2021+; LHS-10k baseline arm. GMST anomaly rel. 1850-1900 (AR6 pre-industrial); GMSL rel. 1995-2014 (AR6 recent-period). Each draw rebaselined at its own window mean before quantiles are computed; obs rebaselined to the same window. Plot range is historical-only (1850-2024); projections are in separate figures.
