

Pulse-marginal Δ SLR (per GtCO₂, 2030 pulse)

Hybrid Hawkins-Sutton variance decomposition of pulse-marginal Δ SLR (per GtCO₂, 2030 pulse). Matched-seed paired difference cancels internal variability by construction ($V_{\text{internal}} = 0$). BRICK posterior is model-free from within-cell variance across 10 paired baseline + pulse BRICK posts. Climate (FaIR configs) and emissions (RFF-SP) from Shapley TreeExplainer on cfg + RFF features. AIS tipping nonlinearity = residual variance lost when the target is p99-clipped per year. Unattributed = residual after tipping.
